

Prof. Dr.

Tjeerd J. Bouma

Date of PhD:

1995

Scopus ID:

<https://orcid.org/0000-0001-7824-7546>

Research motivation / academic profile

Career path: Since the start of his career, Tjeerd Bouma has shown a drive to do frontier applied research: i.e., gaining a fundamental understanding needed to resolve societal problems. During his PhD he did fundamental plant physiological research to identify those maintenance processes that caused the greatest reduction in crop yield (potatoes, tomatoes, and beans), to thereby enable targeted crop-breeding. As a post-doc, he continued this line of research on horticultural fruit trees (apples and oranges), while learning how to place his work in a more fundamental ecological context. When starting as tenure-track scientist at the Royal Netherlands Institute for Sea Research NIOZ (former NIOO-CEME) he completely switched his research focus towards the ecology of intertidal and marine ecosystems. In all research fields his work is still well cited

(<https://scholar.google.nl/citations?user=ogQABXIAAAJ&hl=en>).

Current research lines: Coasts and deltas belong to the most densely inhabited and intensively used areas in the world. The strong competition for space has led to large-scale loss of intertidal ecosystems, despite belonging to the most valuable systems in the world in terms of ecosystem services provided. This has fuelled a major interest in ecosystem restoration for ecosystem services. The research team working with Tjeerd Bouma has hence focussed on understanding i) how to improve restoration practice, ii) how to sustainable benefit from ecosystem services, and iii) assessing the resilience of these valuable ecosystems to climate change.

- **Restoration** of intertidal ecosystems as mangroves, seagrasses and salt marshes often fail, due to strong physical drivers. To enhance restoration success, the research team working with Tjeerd Bouma has focussed on obtaining a fundamental understanding how natural systems establish (e.g., *Balke et al. 2011 Mar Ecol Prog Ser. 440: 1–9*, *Balke et al. 2014 Journal of Ecology 102: 700–708*), and translating this understanding into novel, large-scale applicable restoration concepts (e.g., *Temmink et al. Nature Comm 11 Art# 3668*; *Fivash et al 2022 J Appl Ecol. 59: 1050–1059*). This has led to the broad application of the Windows of Opportunity framework in improving coastal restoration and modelling natural dynamics of biogeomorphic systems (e.g., *Hu et al 2021 Geophys Res Letters 48: e2021GL095596*; *Poppema et al 2019 Ocean Coast Manag. 168: 238–250*).
- **Ecosystem-services** such as e.g., Nature-Based Flood Defense, carbon sequestration, supporting biodiversity, enabling aquaculture, recreation, etc., is a key driver of many restoration efforts. The research team working with Tjeerd Bouma focusses on fundamentally understanding the conditionality of services provisioning, as well as the extent that different services are compatible (i.e., win-win) vs. mutually exclusive (i.e., trade-off choice). Within the scientific community, he contributed to the broad acceptance of using tidal ecosystems as Nature-Based Flood Defense (e.g., *Borsje et al 2011 Ecological Engineering 37: 113–122*; *Temmerman et al. 2013 Nature 504: 79–83*). Novel insights in how nature-based flood defence by salt marshes work when a dike breaches (e.g., *Zhu et al. 2020 Nature Sust. 10: 853*), fuelled societal discussion on transitional polders as novel flood-defence system (*12 debated articles in local news paper PZC*). He actively worked on outreach to the broader public (see list below)
- Understanding the **long-term climate resilience** of ecosystems is a key prerequisite to effectively invest in ecosystem restoration for ecosystem services. To enable this line of research, the team working with Tjeerd Bouma has developed novel field-flume to quantify key parameters needed to feed into models (e.g., *de Smit et al. 2020 Limnol. Oceanogr.: Methods*

18, 585–598; de Smit et al. 2021 Limnol. Oceanogr. 9999, 1–12; James et al. 2019 BioScience 69: 136–142; James et al. 2020 J. of Ecology 108; 2025-2037) and lab set-ups to study bioturbation behaviour under heat stress (e.g., Zhou et al. 2022. Science of the Total Environment 824, 153621).

Positions: The key interest in carrying out fundamental research, that can be translated into application for the benefits of humanity, also translates into having a lector position at the HZ University of Applied Sciences next to academic positions at the Royal Netherlands Institute for Sea Research (NIOZ) and Utrecht University

International visibility, activities, prizes, scholarships, etc.

In addition to being senior scientist at the Royal Netherlands Institute of Sea Research (NIOZ), TJ Bouma was in 2018 appointed for 0.2 FTE as professor at physical geography at Utrecht University, became in 2017 Visiting professor at the school of marine engineering and technology at Sun Yat-sen University in China, is since 2014 honorary professor at Groningen University, and since 2014 Lector at the HZ University of Applied sciences.

In his position as Lector at the HZ-University of Applied Sciences, he was in the lead of the Raak-Pro “Meerwaarde met Mosselen”, which was about creating additional value for different stakeholders (i.e., the aquaculture sector, Nature NGO’s and RWS as governmental managers) by restoring international mussel beds. This project was granted the RAAK-award in 2019

(<https://www.vereniginghogescholen.nl/actueel/actualiteiten/winnaar-raak-award-2019-meerwaarde-met-mosselen-hz-university-of-applied-sciences>)

The visibility of the research of TJ Bouma is reflected in being invited for giving key-note lectures both at national and international conferences (2022 = 1st Symposium on Coastal Research, Spain; 2021 = CORE online conference China & 7th ICEC online conference, China; 2019 = NAEM-conference, The Netherlands; 2018 = ICEC-conference, France & Core-conference, China; 2017 = RCEM-conference, Italy & ECSA-conference, China; 2016 = ECORES-conference, Italy). The international visibility of the work by the research group led by TJ Bouma is also reflected in the work being well cited

(<https://scholar.google.nl/citations?user=ogQABXIAAAJ&hl=en>).

TJ Bouma was rewarded several grants, both as main- and co-applicant. All grants are typically transdisciplinary, with societal relevance. Below some recent examples (last 5 years):

- 2023, main applicant of HPP. Multi-partner project funded to learn from a large-scale managed realignment project (Hedwige Proser Polder), to design future restoration projects and nature-based flood defence schemes.
- 2023, co-applicant of DeltaWEALTH. Transdisciplinary project aimed at analysing the costs and benefits in terms of wealth, of alternative flood-defence strategies for the South-West Delta region
- 2023, co-applicant of DeltaENIGMA, which is an > 10 million EURO NWO Research Infrastructure Grant (2023-2033), aimed at keeping the Dutch research at the forefront of BioGeoMorphology. About 3 million will be invested at NIOZ. Within the programme, TJ Bouma is the lead for the Estuary observations.
- 2022, co-applicant of the TTW-perspective proposal “Future FRM tech”, which is aimed at innovating Flood Risks Management technologies using nature-based solutions under climate change

- 2022, main applicant “Buitendijkse maatregelen II” (BathOssZim). Multi-partner project to learn from ongoing large-scale nature-enhancing projects to design future restorations of intertidal nature.
- 2020, co-applicant of the NWA proposal “living dikes”, which is aimed at technical, ecological and societal implementation of using saltmarshes as sustainable and nature-inclusive flood defence
- 2019, main applicant of the TTW North-Sea ReViFES (Reef Vitalization for Ecosystem Services), which is aimed on creating reefs that enhance biodiversity but at the same time enable sustainable aquaculture and fisheries
- 2019, co-applicant of the TTW-Woody proposal, which is aimed on designing riverbanks with willow trees that are both biodiverse as well as are effective as wave-breakers
- 2019, co-applicant of the NWO-Living Lab Hedwige Proser Polder. This transdisciplinary proposal was fully based on the findings published in the paper of Zhu et al. (2020) - Nature Sustainability (for details, see key papers), and focusses on a completely new function of foreshores for flood safety, by reducing dimensions of dike-breaches

Based on his expertise, TJ Bouma is member of various Societal and Scientific committees, like

- Member of the European Marine Board working group ‘Coastal Resilience’
- scientific council “de wilde denktank”, of the NGO, ARK Natuurontwikkeling
- Board member, The Netherlands Ecological Research Network (NERN)
- Member of Academic board – MSc-course River Delta Development (HZ University of applied Sciences, Rotterdam University of Applied Sciences, Van Hall Larenstein University of Applied Sciences)
- Program Committee of Netherlands Centre of Coastal Research (NCK) – ended in 2022

Examples of 6 recent (last 5 years) publications with clear societal impact

- 1) Temmink RJM, Christianen MJA, Fivash GS, et al., **Bouma TJ**, van der Heide T (2020) Mimicry of emergent traits amplifies coastal restoration success. *Nature Communications* 11, Article Number: 3668, DOI: 10.1038/s41467-020-17438-4 → *this paper reports on successful experiments that were carried out with stake-holders in search of more successful restoration techniques. We are now discussing the options for upscaling*
- 2) Zhu ZC, Vuik V, Visser PJ, et al., **Bouma TJ** (2020) Historic storms and the hidden value of coastal wetlands for nature-based flood defence. *Nature Sustainability* 10; 853-. DOI: 10.1038/s41893-020-0556-z → *the findings reported in this paper formed the base of the funded Living-Lab Hedwige project, where stakeholders are now large-scale exploring the safety that salt-marshes provide in case of a dike breaching. These findings also inspired a WWF-funded exploration into the feasibility of the large-scale implementation of double-dike systems with transitional polders, which has led to twelve discussion articles in the local news paper and is currently discussed as future-proof flood defence solution in the political arena and has become part of the national Delta-plan*
- 3) Schotanus J, Walles B, Capelle JJ, Belzen J, Koppell J, **Bouma TJ** (2020) Promoting self-facilitating feedback processes in coastal ecosystem engineers to increase restoration success: Testing engineering measures. *Journal of Applied Ecology* 57: 1958-1968. DOI: 10.1111/1365-2664.13709 → *Rijkswaterstaat (RWS) has the intention to apply the method described in this paper for restoring mussel-beds at exposed locations, as erosion protection around the upcoming sand-nourishment at the Galgeplaat (Oosterschelde)*
- 4) James RK, Silva R, van Tussenbroek BI, et al., **Bouma TJ** (2019). Maintaining tropical beaches with seagrass and algae: a promising alternative to engineering solutions. *BioScience*, 69(2), 136-142. → *in*

the press release about this paper, we had enthusiastic quotes from both WWF and from the international dredging and offshore contractor van Oord, indicating that they both are interested in finding opportunities for large-scale application

- 5) Leuven JRFW, Pierik HJ, van der Vegt M, **Bouma TJ**, Kleinhans MG (2019) Sea-level-rise-induced threats depend on the size of tide-influenced estuaries worldwide. *Nature Climate Change* 9: 986-+. DOI: 10.1038/s41558-019-0608-4 → *this paper identifies the problem of drowning tidal flats under future sea level rise, and was key to rising awareness with end-users of this problem. As such, this paper has led to the support of end-users to start developing novel systems that can be used to prevent drowning of tidal flats (part of 2022 funded TTW-perspective program Future FRM Tech)*
- 6) Fivash GS, van Belzen J, Temmink RJM, Didderen K, Lengkeek W, van der Heide T, **Bouma TJ** (2022) Increasing spatial dispersion in ecosystem restoration mitigates risk in disturbance-driven environments. *J Appl Ecol.* 59, pp 1050-1059 → *this paper reports on a theoretical upscaling framework for BESE*

12 key publications

- 1) Fivash GS, van Belzen J, Temmink RJM, Didderen K, Lengkeek W, van der Heide T, **Bouma TJ** (2022) Increasing spatial dispersion in ecosystem restoration mitigates risk in disturbance-driven environments. *J Appl Ecol.* 59, pp 1050-1059
- 2) Zhou Z, **Bouma TJ**, Fivash GS, Ysebaert T, van IJzerloo L, van Dalen J, van Dam B, Walles B (2022) Thermal stress affects bioturbators' burrowing behavior: A mesocosm experiment on common cockles (*Cerastoderma edule*). *Science of the Total Environment* 824 (2022) 153621
- 3) de Smit JC, Bin Mohd Noor MS, Infantes E, **Bouma TJ** (2021) Wind exposure and sediment type determine the resilience and response of seagrass meadows to climate change. *Limnol. Oceanogr.* 9999, 1–12; doi: 10.1002/lno.11865
